

# Boosting Sugarcane Productivity By Recycling Crop And Industry Residues (trash, stubbles, filter-cake)

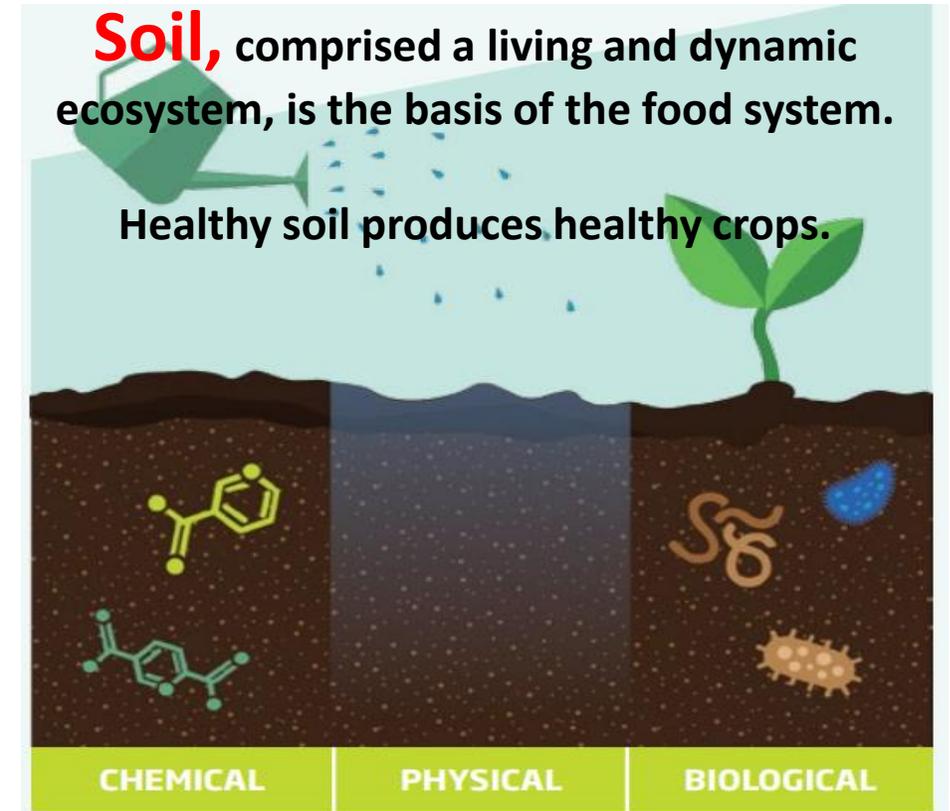

Dr. Sagheer Ahmad  
PARC Islamabad

# Why Organic Matter (OM)?

**Organic Material:** A pile plant and animal material such as leaves, manure and other organic wastes in the soil is not OM, but organic material. It is >1 %

**Organic Matter:** Organic material, when acted upon by various soil microbes and decomposed into humus becomes OM. It is < 0.6%

- Organic material is unstable OM is stable form.
- SOM comprises microbes (10-40%) and stable organic compounds (40-60%).
- **CHEMICAL:**
  - Improves the soil's capacity to restore, store and supply essential nutrients.
  - It allows the soil to cope with changes in soil alkalinity/acidity.
- **PHYSICAL:**
  - Soil structure.
  - Water retention: up to 90% of its weight that is available to plants
  - Soil erosion, Water infiltration & water holding capacity.
- **BIOLOGICAL:**
  - Primary source of carbon (C): gives energy and nutrients to soil organisms.
  - It supports soil functionality by improving activity of microorganisms i.e., soil biodiversity.
  - Mitigates climate change: C- sequestration in the soil lowers emissions of CO<sub>2</sub> to the atmosphere.

# Some facts about fertilizers use

## For sugarcane growing

- **60% farmers use less than 3 bags of urea per acre**
- **70% farmers less than 2 bags of DAP**
- **90% farmers do not use Potash**

•

- (Source: Annual Report 2004-05 NIINMS, Sugar Crops, NARC)

# Some facts about Soil

## **In Jhang & Sargodha districts:**

- All the soils are deficient in plant available N (<11 mg kg<sup>-1</sup> NO<sub>3</sub>-N)
- 98% soils ---- in P (<4 mg kg<sup>-1</sup>)
- 45% soils ---- in K (<125 mg kg<sup>-1</sup>)
- 60% soils ---- in B (<0.50 mg kg<sup>-1</sup> HCl extr. B)
- 92% soils ---- in Zn (<1.0 mg kg<sup>-1</sup>)

(Source: Annual Report 2004-05 NIINMS, Sugar Crops, NARC)

# Sugarcane

- Sugarcane is one of the **top-most promising agricultural sources of biomass producer** in the world.
- According to the *International Sugar Organization (ISO)*, Sugarcane is a highly efficient converter of solar energy.
- Sugarcane can return about 15-20 ton ha<sup>-1</sup> of organic matter, containing 6-8 ton ha<sup>-1</sup> of carbon to the soil surface (**Thangarajan et al., 2013**).
- Sugarcane comprised mainly following biomass:
  - **Cane Trash:** field residue remaining after harvesting the Cane stalk.
  - **Cane Stubbles:** underground field residue remaining after harvesting the Cane stalk.
  - **Cane Juice:** comprised water, sugars, minerals etc.
  - **Mill Bagasse:** by-product which remains after extracting sugar from the stalk
  - **Mill press mud:** Waste removed during purifying sugarcane juice

# Sugarcane Trash

- It represents about 15% of the total above ground biomass at harvest.
- During harvesting operation around 70-80% of the cane trash is left in the field.

# Trash Management.

- **Burning the trash**

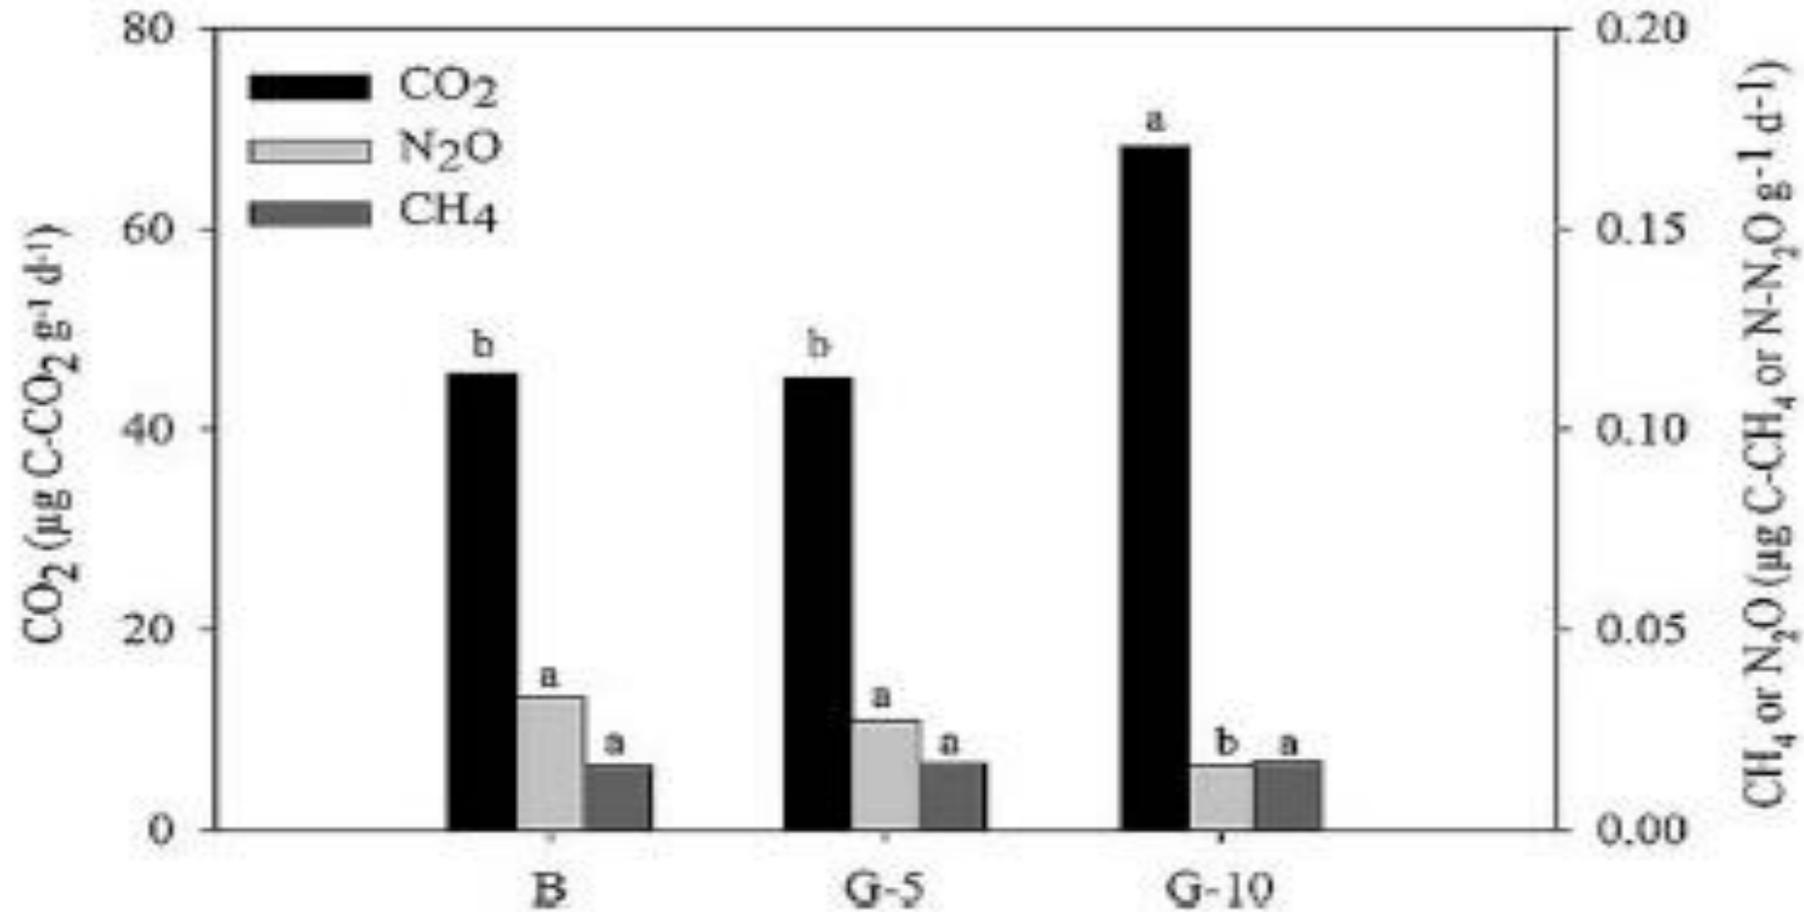

Most deleterious method: Pollution

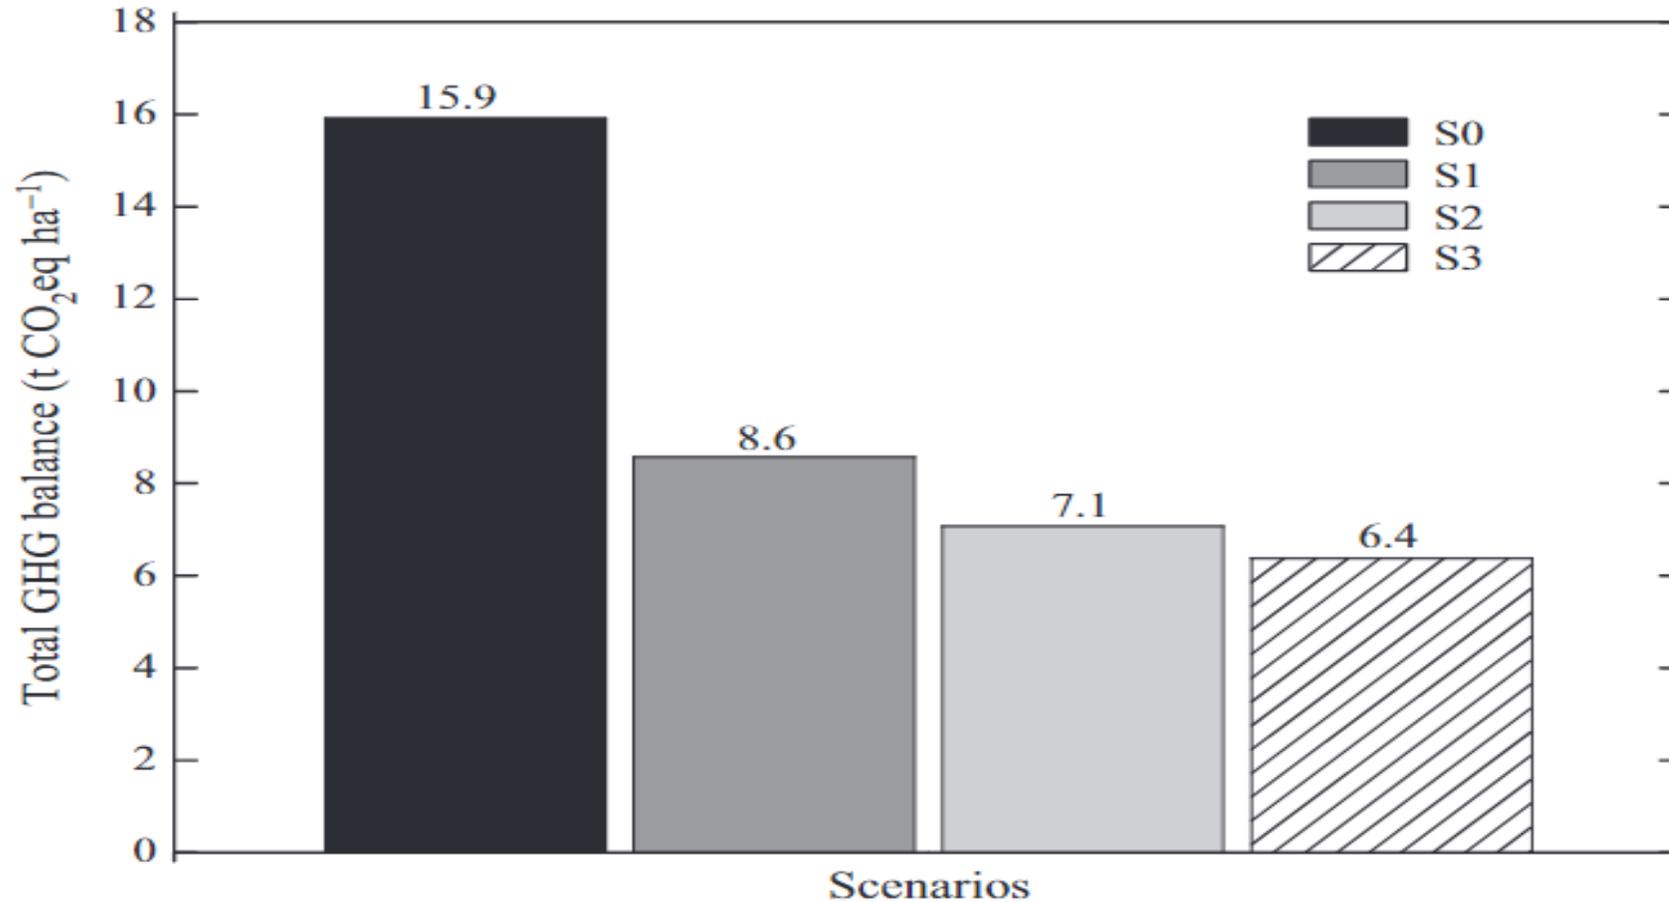

Easy in field operations

Sources of GHG ( $N_2O$ ,  $CO$ ,  $CO_2$ )

Predicted average production rate of CO<sub>2</sub>, N<sub>2</sub>O, and CH<sub>4</sub> in the burned sugarcane (B), green sugarcane for 5 years (G-5), and green sugarcane for 10 years (G-10) ---- (Tavares, 2018)

Total balance of greenhouse gases emissions (in ton CO<sub>2</sub>eq ha<sup>-1</sup>) for sugarcane production scenario for 6 years --- (Bordonal et al, 2012)

S0: a burned harvest + conventional tillage, S1: green harvest + conv. tillage, S2: green harvest + reduced tillage and S3: green harvest +reduced tillage + a crop rotation with *Crotalaria juncea* L.

# Sugarcane Trash Management

- Use as mulch for moisture conservation.
- Incorporating trash in soil for moisture and nutrients

Trash Blanket: **moisture conservation**

Trash Incorporation: decompose --- Sources of OM,  
Nutrients, moisture retention

K requirements reduced by 25-30 Kg/ha

N requirement reduced by 50-60 Kg/ha

# Comparison of Trash Blanket and Burning

<b>Treatment</b>	<b>Cane yield t/ha</b>
<b>Trash lined in alternate inter rows</b>	<b>88.7</b>
<b>Trash blanket</b>	<b>95.1</b>
<b>Trash burning</b>	<b>83.9</b>

Source : McIntyre et al 1996

# **Cane Trash on Decomposition Adds to the Soil**

- **5.3 kg N per ton of trash**
- **1.1 kg P per ton of trash**
- **5.8 kg K per ton of trash**
  
- **Incorporating 5 tones trash with 75 kg N fertilizer increased cane yield by 37.5 %**
- **Fertilizer dose reduced by 50 %**

Source : Verma, 2002

# Sugarcane Stubbles management ???

**Site of important microbiota: Mycorrhizea, Bacteria, Fungi, P solublizers**

**Source of soil OM, Nutrients for plants and & C for MO**

# Stubble Incorporation

**Left over stubbles : 5-10 ton/ha**

**Roots : 3-6 ton/ha**

**Nutrients ha:**

<b>N</b>	<b>50-100 kg</b>
----------	------------------

<b>P</b>	<b>5-10 kg</b>
----------	----------------

<b>K</b>	<b>30-90 kg</b>
----------	-----------------

<b>Ca</b>	<b>30-50 kg</b>
-----------	-----------------

<b>Mg</b>	<b>15-25 kg</b>
-----------	-----------------

<b>S</b>	<b>8-18 kg</b>
----------	----------------

**Burning  
/Removal results in  
lose of O.M &  
nutrients, and No.  
of microbiota**

# Filter-cake/Press mud Management

# Filter-cake/Press mud Management

Production & application estimate

<b>YEAR</b>	<b>Sugarcane Area (000 acres)</b>	<b>PM Production (000 ton)</b>	<b>Estimate (50% area) (ton/acre)</b>
<b>2018-19</b>	<b>2719</b>	<b>1490</b>	<b>1.09</b>
<b>2019-20</b>	<b>2564</b>	<b>1441</b>	<b>1.12</b>
<b>2020-21</b>	<b>2875</b>	<b>1758</b>	<b>1.22</b>
<b>2021-22</b>	<b>3112</b>	<b>2064</b>	<b>1.32</b>

# Composition of different manures (kg/ton)

<b>Manure type</b>	<b>OM</b>	<b>Total N</b>	<b>P<sub>2</sub>O<sub>5</sub></b>	<b>K<sub>2</sub>O</b>
<b>Chicken Manure (fresh, broiler, layer etc)</b>		<b>13-36</b>	<b>8-40</b>	<b>6-23</b>
<b>FYM</b>		<b>20-25</b>	<b>6-8</b>	<b>5-6</b>
<b>Pressmud</b>	<b>550-600</b>	<b>15-16</b>	<b>11-13</b>	<b>7-10</b>

# Effect of fertilizers & PM on Cane yield

<b>Practice</b>	<b>Yield (Md/Acre)</b>	<b>Difference (md/Acre)</b>
<b>Farmers Practice</b>	<b>625</b>	<b>--</b>
<b>Recommended fertilizer (NPK, Zn and B)</b>	<b>720</b>	<b>95</b>
<b>Half NPK +Zn and B and 4 ton PM (DWB)</b>	<b>765</b>	<b>140</b>

(Source: Final Report 2004-08 ALP-NIINMS Project, Sugar Crops, PARC)

# Effect of press mud on physico-chemical characteristics of the soil

Treatments	Physico-chemical characteristics of the Sandy loam soil						
	Bulk Density (g cm <sup>-3</sup> )	pH	EC <sub>e</sub> (dS m <sup>-1</sup> )	O.M. %	Total N (mg kg <sup>-1</sup> )	Avail. P (mg kg <sup>-1</sup> )	Avail. K (mg kg <sup>-1</sup> )
No PM	1.32	8.1	0.39	0.800	310	8	161
PM 2 t ha <sup>-1</sup>	1.32	8.1	0.42	0.816	400	52	186
PM 4 t ha <sup>-1</sup>	1.32	8.0	0.42	0.830	460	106	205
PM 10 t ha <sup>-1</sup>	1.30	7.9	0.50	0.848	680	220	234

(Ghulam *et al.*, 2010, D.I. Khan)

# BIOCOMPOSTING

It is a process to treat PM with effluent making an environment friendly stable product which could increase the productivity of  
**Soils and Plants**

# Organic Manure Production Process at Sugar Mills

## COMPOST PROCESS

Pressmud

Making Windrows

Unloading Pressmud in Windrows

Spentwash Spraying

Addition Of Culture in Windrows

Pressmud Windrows

Aero trilling

COMPOST

## Effect of enriched pressmud (pleorotus & trichoderma fungi) & bio-compost on yield and quality of Sugarcane

Treatments	CCS %	Cane yield t/ha
100% NPK	12.45	84.3
75% NPK	12.49	70.3
75% NPK + EPM-P (10 t/ha)	13.51	86.7
75% NPK + BC (10 t/ha)	13.40	86.0
CD (P=0.05)	NS	9.40**

(Rakkiyappan et al., 2001)

**THANKS**
